Royal Square Financial (Pty) Ltd - FSP Number: 29370 - Director: Qiniso Ntuli

Reg. No. 2009/ 022911/ 07 | 4 Pritchard Street, Johannesburg – 2001 | office: 011 492 1566

II. Business Description & Problem Statement

Royal Square Financial (Pty) Ltd is an independent full-service Brokerage and Financial Services Provider that is focused on wealth creation and wealth preservation through financial planning, offering a range of insurance and investment solutions to the public including Life Insurance, Health Insurance, Funeral Insurance, Personal Insurance, Commercial Insurance and goal-based Investments.

We're a broker. We sell investment and insurance products from South Africa's biggest providers like Sanlam, Old Mutual, Liberty, Momentum, Discovery, Allan Gray, Santam and around a dozen others, but the advice we give clients is our own. We're not tied to any of them. The problem is paperwork. Regulation means every adviser needs formal qualifications, and every client interaction generates compliance admin; identity checks, record-keeping, data protection. That load grows every year. We now spend more time on forms than with the people we're meant to be advising, and software is the only way out.

What we need you to build

A system that makes communication between Royal Square Financial and our clients faster and less manual. Three core pieces:

A client dashboard. A real-time view of each client's financial position and net worth, in one place.

Automated reminders. For tasks, documents, renewals and reviews — sent to us, to the client, or to both. Some examples:

- Insurance valuation certificate, every 2 years → us and the client
- Driving licence expiry → client
- Annual financial review meeting → us
- Retirement fee renewal → us
- Birthdays and anniversaries → us, automated

There are many more. Assume the list keeps growing.

Goal tracking. Advisers should be able to load goals for a client — individual or shared — and the dashboard should show visually how far along each one is.

Example: a full single task

Short-term insurance — reporting an accident

The client taps **Report an Accident or Loss**. The app immediately sends back a checklist of what to gather at the scene:

- Photos of the road surface and direction of travel
- The address or nearest cross streets
- Photos of all vehicles and people involved
- Licence plates and registration discs
- ID documents of everyone involved
- Witness names and contact details, plus a voice note if possible
- Insurance details of the other parties

- A reminder to report to the police within 48 hours

Getting this right at the scene is what makes the claim go smoothly later.

Registering the claim

The client taps **Register a Motor Claim** and selects their insurer — Santam, for example, though we work with many.

The app collects:

- Date, time and description of the incident
- Whether police were notified, and the case number
- Witness details and whether a statement was taken
- Who was driving, and whether the vehicle was in personal or business use
- Details of other vehicles or property involved
- Third party details: licence, vehicle registration, insurer and policy number

And uploads to the cloud:

- Photos of all vehicles, damage, road surface, registration discs and licences
 - Driver's licence and a sketch of the accident
-

What happens after submission

This part runs over days and weeks, and the app's job is to track it and keep everyone informed:

1. Insurer returns a claim number and a claims handler
 2. Client takes the vehicle for assessment
 3. Assessment goes to the insurer and to us
 4. Repair quotes go to the insurer
 5. Insurer authorises repairs
 6. Client picks a date for the vehicle to go in
 7. We arrange car hire and delivery to the repairer
 8. Weekly repair updates pushed to us
 9. We arrange collection and return of the hire car
 10. Client writes a short review and closes the transaction
-

Other tasks the app should handle

Change of address · Change of bank details · Request a policy document · Request a border letter · Request an IRP5 from an investment company · Request a consultation · Client information collection, balance sheet and income statement

One principle throughout: the more that passes straight through to the product provider automatically — API, direct integration, file transfer — the more useful the app becomes.
